

## Creating a Compact Flash Card with PVI Transfer

1. Download the files with the link received from GuH
2. Extract the files into a folder (e.g. on the Desktop)
3. Open the extracted folder
4. Look for the file PVI Transfer, right click and select **“Run as administrator”**

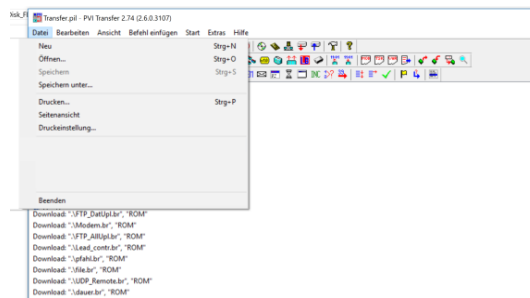

*It may be necessary to select “Get your apps and devices working”, there for please look in the internet for the next stages for your Windows version.*

The PVI Software starts with

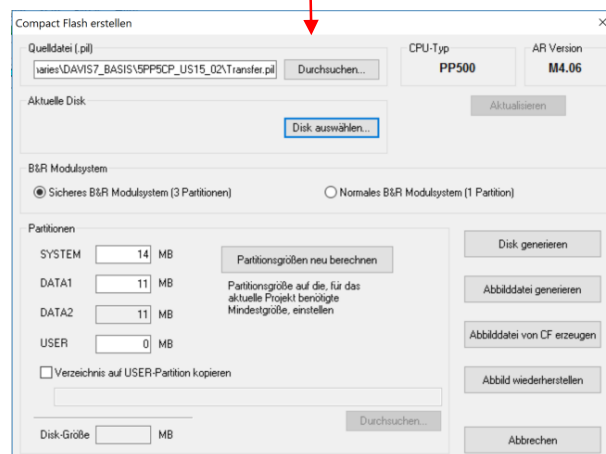

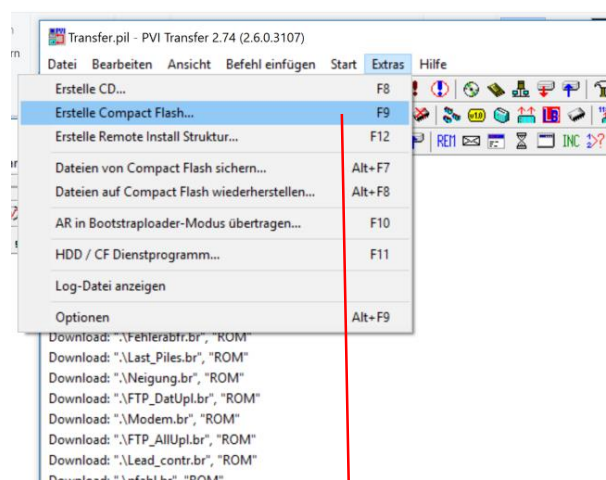

5. Select "Datei öffnen" to make sure, the right \*.pil file is selected.

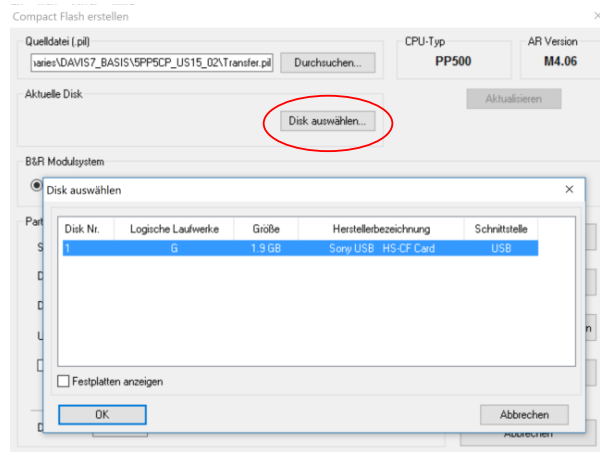

Select the \*.pil file in the extracted folder

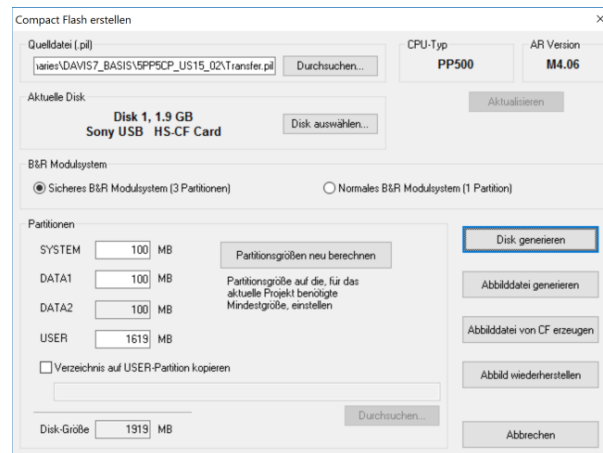

6. Select "F9" or "Erstelle Compact Flash"

7. Select “Disk auswählen” and select the drive with the compact flash card in it.

8. Set the partition sizes

**Recommended sizes for an 2GB card**

System = 100MB  
 DATA1 = 100MB  
 DATA2 = 100MB  
 User = Card size (Disk-Größe) – 300MB

**Recommended sizes for an 512MB card**

System = 50MB  
 DATA1 = 50MB  
 DATA2 = 50MB  
 User = Card size (Disk-Größe) – 150MB

9. Select “Disk generieren” and the warning screen pops up

*The card will be formatted and all data on the card will be lost.*

Select “Ja” to start the process...

When the process is finished without any error this screen pops up

Select “ok” and the card can be unplugged and can be put into the monitor.
